INTRODUCTION

Between 1994 and 1996 some 84,876 passenger vehicles were involved in fatal crashes in the United States in which one or more occupants were fatally-injured. Of those 84,876 passenger vehicles, 3,269 (3.85 percent) experienced fires (Figure 1).

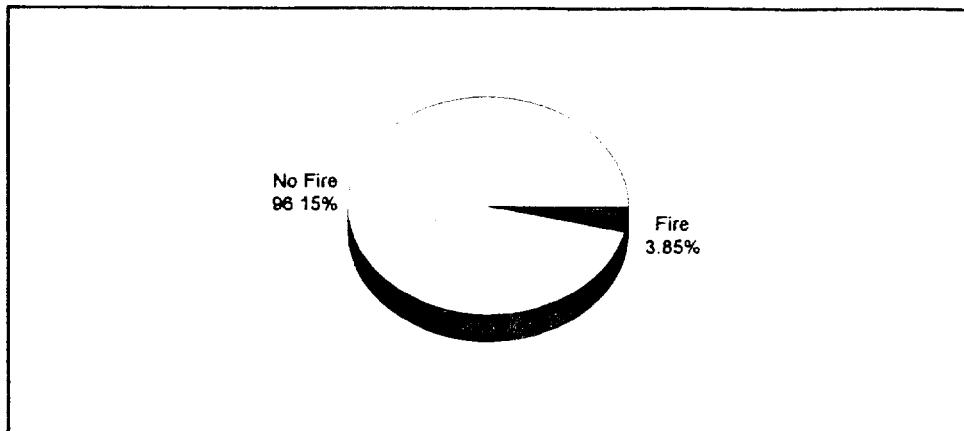

Figure 1: Passenger Vehicles Containing One or More Fatally-Injured Occupants (N = 84,876) that Did or Did Not Experience Fires (FARS 1994-1996)

The purpose of this report is (a) to describe the circumstances and conditions surrounding those passenger vehicles (that contained one or more fatally-injured occupants) and that experienced fires, and (b) to compare and contrast the circumstances and conditions surrounding vehicles experiencing fires to the circumstances and conditions surrounding other passenger vehicles (that contained one or more fatally-injured occupants), but that did not experience fires.

The data used in this report are taken from the Fatality Analysis Reporting System (FARS). These data were downloaded from the National Highway Traffic Safety Administration's (NHTSA's) FTP server for calendar years 1994 through 1996. The record counts for the nine files that were downloaded are shown in Table 1.

Table 1: Record Counts for Nine FARS Files Provided by NHTSA

Year	Crash File	Vehicle File	Person File
1994	36,254	54,911	98,945
1995	37,241	56,524	102,102
1996	37,351	57,136	102,955
Total	110,846	168,571	304,002

PROCEDURE

This paper is concerned only with “passenger vehicles” (containing one or more fatally-injured occupants) that did or did not experience fires. The definition of passenger vehicle used herein is taken from NHTSA and based primarily upon vehicle body type (BODY_TYP):¹

BODY_TYP = 01-11, 14-16, 19-22, 24, 25, 28-33, 39-41, 45, 48, 49 or (79 and *Vehicle Trailing* is none (0) or unknown (9))

Applying this definition of passenger vehicle to the 168,571 vehicles in the FARS vehicle files (1994-1996) yields 143,929 passenger vehicles. These 143,929 passenger vehicles are divided into five “vehicle classes” (as defined by NHTSA): 91,809 passenger cars, 31,534 pickups, 10,059 utility vehicles, 9,985 vans, and 542 other passenger vehicles. More detail is provided in Table 2. Note that in Table 2 “unknown truck” (BODY_TYP = 79) is classified as a passenger vehicle in 20 of 21 cases (i.e., in 20 of 21 cases “vehicle trailing” equaled 0 or 9).

In Table 3, the 168,571 vehicles contained in FARS (1994-1996) are further broken down to define those passenger vehicles that were involved in single-vehicle and multi-vehicle crashes and that contained at least one fatally-injured occupant, by vehicle class (passenger car, pickup, utility vehicle, van, and other passenger vehicle).²

The balance of the analyses in this report will refer to the circumstances and conditions surrounding the passenger vehicles depicted as the 10 right-most cells in Table 3—those that experienced fires, and those that did not.

Appendix A provides cross tabulations of the single-vehicle, passenger vehicle data shown in Table 3. Each of these cross tabulations is of the form: X by Vehicle Class by Fire Experience (where X stands for different crossing variables of potential interest to this effort, e.g., first harmful event, roadway functional class, time of day, day of week, light condition, driver age and sex, etc.). The numbers contained in the cells in the cross tabulations in Appendix A are column percentages.

Appendix B provides the same basic information contained in Appendix A, but for passenger vehicles involved in multi-vehicle crashes rather than single-vehicle crashes.

¹“Fatality Analysis Reporting System (FARS) 1992-1996 Analytical Data Classification,” National Center for Statistics and Analysis, USDOT/NHTSA (no date).

²Single-vehicle crashes were defined to include those crashes for which only one vehicle form was available (VE_FORMS = 1). Multi-vehicle crashes were defined to include those crashes for which two or more vehicle forms were available (VE_FORMS > 1). By this definition, 40,616 vehicles were found to have been involved in single-vehicle crashes and 44,260 in multi-vehicle crashes.

RESULTS

The findings provided in this section can be derived from the data that are summarized in the cross tabulations contained in Appendices A and B. These appendices should be referred to for additional detail.

Table 4 summarizes the basic data that were available for these analyses.

Table 4: The Numbers of Passenger Vehicles that Contained One or More Fatally-Injured Occupants, by Type of Crash (Single-Vehicle versus Multi-Vehicle), Vehicle Class, and Fire Experience				
Type of Crash and Vehicle Class		Fire Experience		Total
		No Fire (%)	Fire (%)	
Single-Vehicle Crashes	Passenger Cars	24,149 (95.50)	1,138 (4.50)	25,287
	Pickups	9,350 (96.27)	362 (3.73)	9,712
	Utility Vehicles	3,453 (96.80)	114 (3.20)	3,567
	Vans	1,887 (96.03)	78 (3.97)	1,965
	Other Passenger Vehicles	80 (94.12)	5 (5.88)	85
Multi-Vehicle Crashes	Passenger Cars	32,848 (97.01)	1,012 (2.99)	33,860
	Pickups	6,043 (94.07)	381 (5.93)	6,424
	Utility Vehicles	1,621 (94.57)	93 (5.43)	1,714
	Vans	2,110 (96.39)	79 (3.61)	2,189
	Other Passenger Vehicles	66 (90.41)	7 (9.59)	73
Total		81,607 (96.15)	3,269 (3.85)	84,876

VEHICLES INVOLVED IN SINGLE-VEHICLE CRASHES

After controlling for vehicle class (passenger car, pickup, utility vehicle, and van), the similarities and differences between passenger vehicles that experienced fires and those that did not can be divided into two major groups: (1) crash and vehicle characteristics and (2) driver characteristics.

It should be understood that single-vehicle crashes may involve collisions with "parked motor vehicles" or "transport devices used as equipment" (e.g., "cherry picker at work, paint stripper at work, etc."), though these situations are relatively uncommon (Table 5).

Table 5: The Numbers and Percent of Passenger Vehicles Involved in Single-Vehicle Crashes (that Contained One or More Fatally-Injured Occupants) by Selected First Harmful Events and Fire Experience

First Harmful Event	Fire Experience				Total	
	No Fire		Fire			
Parked Motor Vehicle	838	2.15%	41	2.42%	879	2.17%
Transport Device Used as Equipment	70	0.18%	1	0.06%	71	0.17%
All Other First Harmful Events	38,011	97.67%	1,655	97.52%	39,666	97.66%
Total	38,919	100.00%	1,697	100.00%	40,616	100.00%

Crash and Vehicle Characteristics³

Within vehicle class, vehicles that did and did not experience fires are quite comparable in terms of location (urban/rural) (Figure 2) and highway class (route signing) (Figure 3).

Of the 45 categories in FARS that describe the “first harmful event” in a crash, the two categories that were most often used for the 40,616 passenger vehicles represented in Figure 4 were “overturn” and “collision with a tree.” For those vehicles that did not experience fires, “overturn” was a relatively more common outcome. For 16.58 percent of the passenger cars, 29.01 percent of the pickups, 46.48 percent of the utility vehicles, and 31.37 percent of the vans, “overturn” was coded as the “first harmful event” in the crash. By contrast, the percentages for those vehicles that did experience fires were 5.36 percent for passenger cars, 10.22 percent for pickups, 12.28 percent for utility vehicles, and 10.26 percent for vans.

When “rollover” was used in Figure 5 to compare passenger vehicles that did and did not experience fires, the same phenomenon that was seen with “first harmful event” is repeated. Rollovers as “first events” in the crash were relatively more common for vehicles that did not experience fires. Secondary or “subsequent” rollover was comparable for vehicles that did and did not experience fires.

³Throughout the body of this report, further analysis of “other passenger vehicle” is suspended due to the small size of the sample and the meaning (or lack of meaning) of “other passenger vehicle.” Both Appendices A and B, however, do provide additional detail on “other passenger vehicle.”

Note, too, that in this 1994-1996 data set, relatively few utility vehicles and vans involved in single-vehicle crashes experienced fires, 114 and 78, respectively (Table 4).

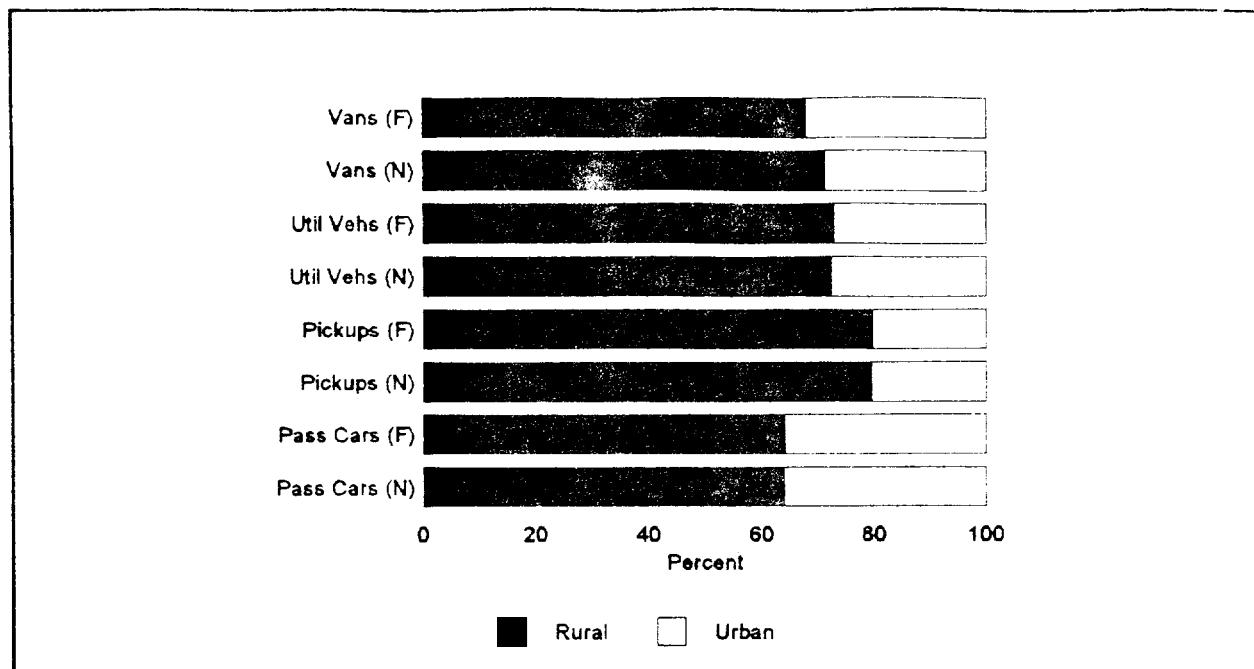

Figure 2: Vehicles Involved in Single-Vehicle Crashes by Location (Urban/Rural), Vehicle Class, and Fire Experience [No Fire (N); Fire (F)]

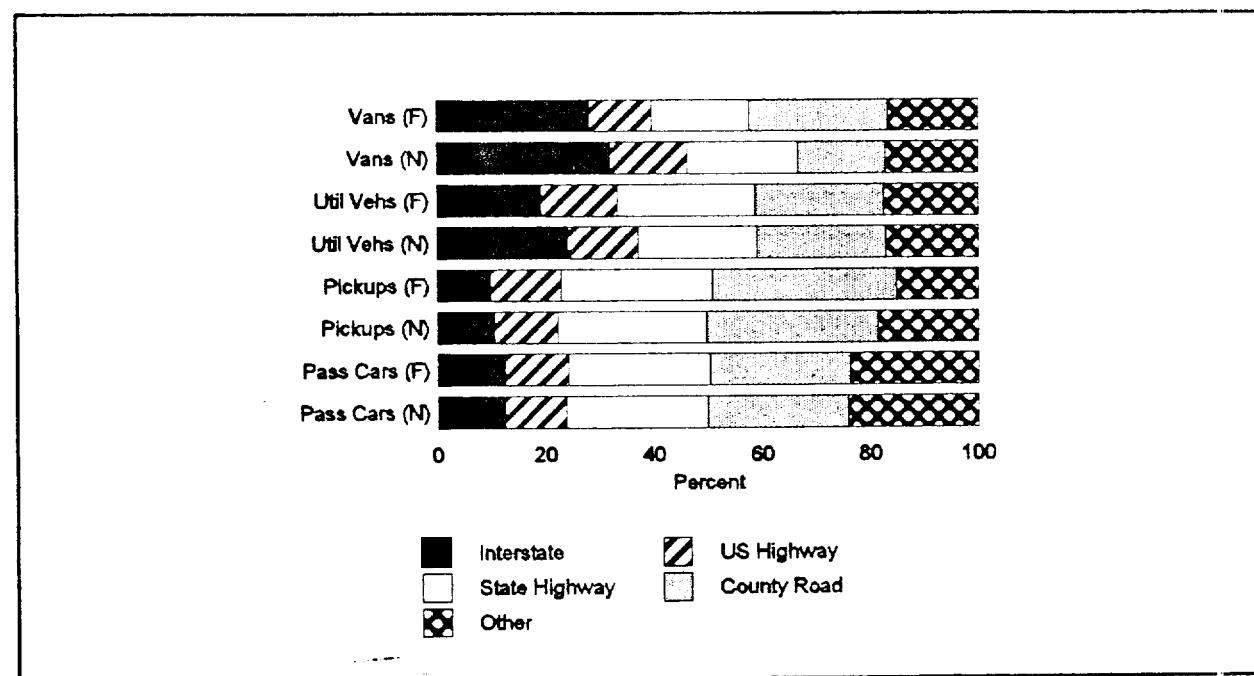

Figure 3: Vehicles Involved in Single-Vehicle Crashes by Highway Class (Route Signing), Vehicle Class, and Fire Experience [No Fire (N); Fire (F)]

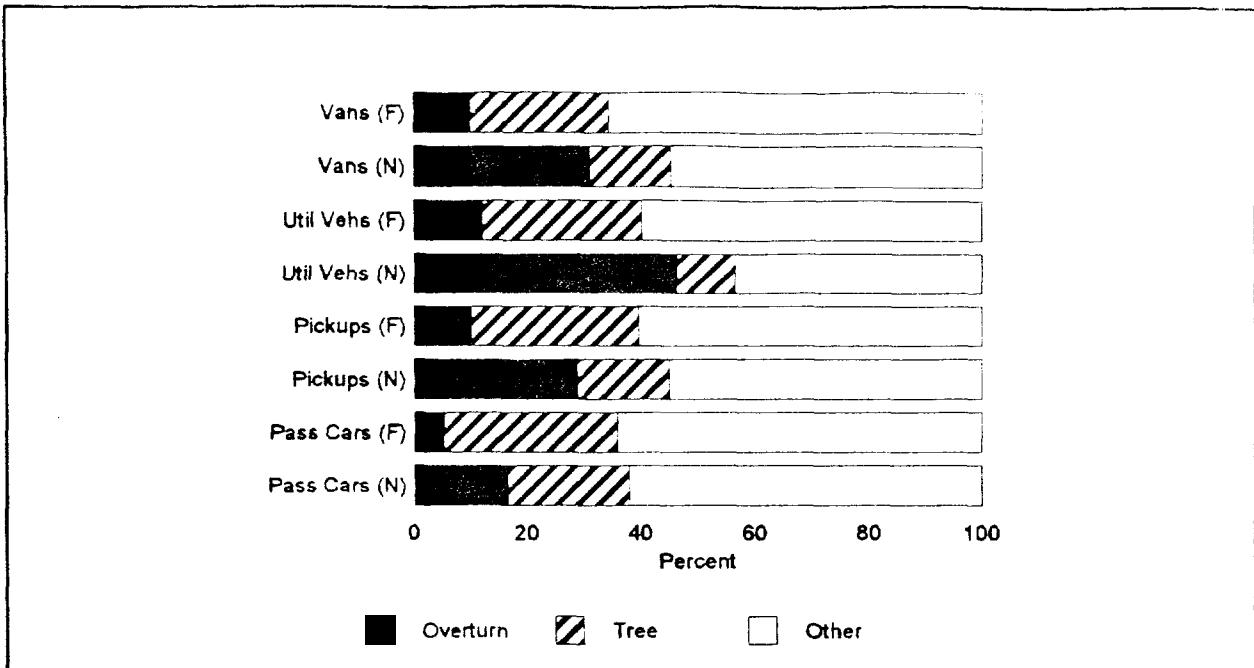

Figure 4: Vehicles Involved in Single-Vehicle Crashes by First Harmful Event, Vehicle Class, and Fire Experience [No Fire (N); Fire (F)]

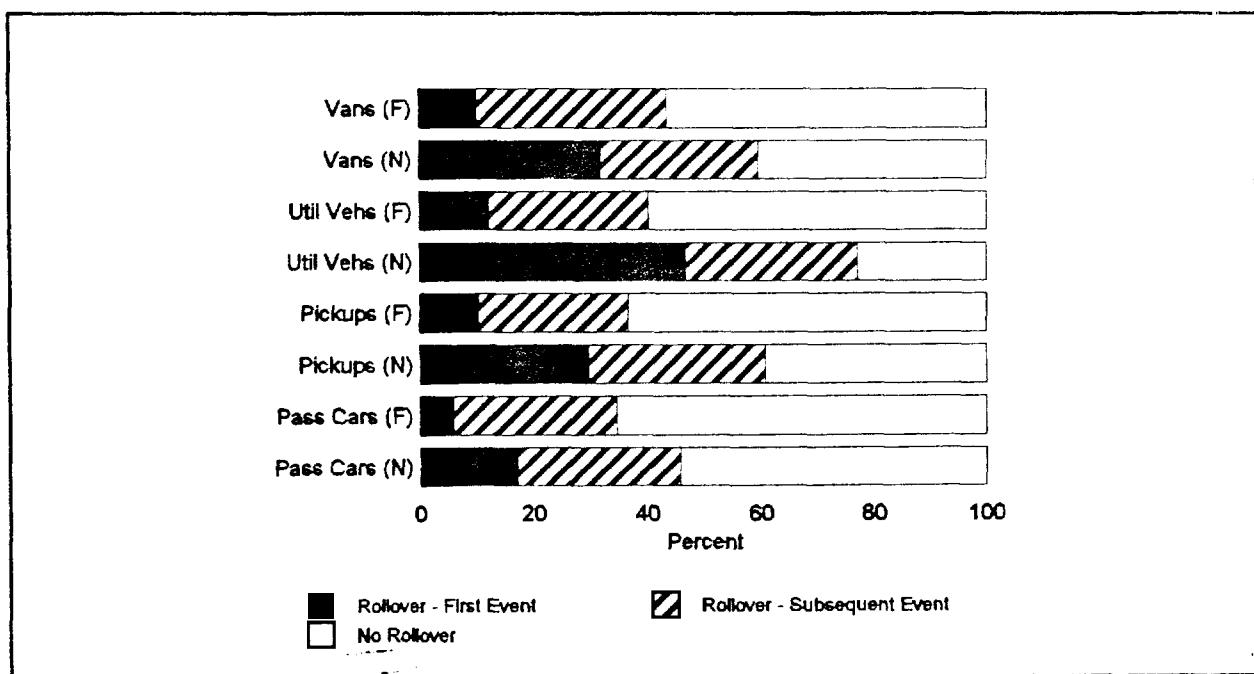

Figure 5: Vehicles Involved in Single-Vehicle Crashes by Rollover, Vehicle Class, and Fire Experience [No Fire (N); Fire (F)]

Crashes in which passenger vehicles experienced fires were relatively more common after dark (Figure 6). For passenger cars that experienced fires, 75.04 percent were recorded after dark. For pickups, utility vehicles, and vans, the percentages were, 68.78, 71.93, and 64.10 percent, respectively. For those vehicles that did not experience fires, the figures for passenger cars, pickups, utility vehicles, and vans were, respectively, 60.94, 61.84, 56.68, and 45.15 percent.

Crashes in which passenger vehicles experienced fires were also relatively more common during the six-hour period extending from 10:00 pm to 4:00 am (Figure 7).⁴

The initial points of impact for passenger vehicles that did and did not experience fires in single-vehicle crashes are shown in Figures 8 through 11 (for passenger cars, pickups, utility vehicles, and vans, respectively). The most conspicuous difference between the vehicles that did and did not experience fires in these figures was “non-collision.”⁵ The initial (and principal) points of impact for non-fire vehicles are much more apt to be coded as “non-collision,” which is in keeping with Figures 4 and 5. For all four classes of vehicles that experienced fires, 12 o’clock was the most common point of impact. For vehicles that did not experience fires, 12 o’clock was also the most common point of impact, except for utility vehicles which were more apt to overturn (i.e., non-collision, 42.05 percent) than strike an object head-on (i.e., 12 o’clock, 26.53 percent).⁶

Driver Characteristics

The great majority of drivers in these single-vehicle crashes (those that experienced fires and those that did not) were male. However, vehicles that experienced fires were somewhat more likely to have been driven by males (Figure 12).⁷

Of the several driver descriptors and characteristics provided in Appendix A that were considered as potential segregating variables associated with vehicle fires (e.g., driving on an invalid license, driving while intoxicated, previous convictions for DWI and speeding, previous suspensions and revocations, etc.), none really stood out.

⁴The percentages of vans that crashed between 10 pm and 4 am were not significantly different (at $\alpha = 0.05$) with regard to fire experience

⁵“If FIRST HARMFUL EVENT is coded 01-07 and no impact to the vehicle occurs throughout the accident, then code IMPACT POINT-INITIAL as 00, IMPACT POINT-PRINCIPAL as 00, and VEHICLE ROLE as 0,” 1994 FARS Coding and Validation Manual, p 240.

⁶ Principal points of impact correlate highly with initial points of impact. See Appendix A.

⁷The percentages of pickup drivers who were male were not significantly different (at $\alpha = 0.05$) with regard to fire experience.

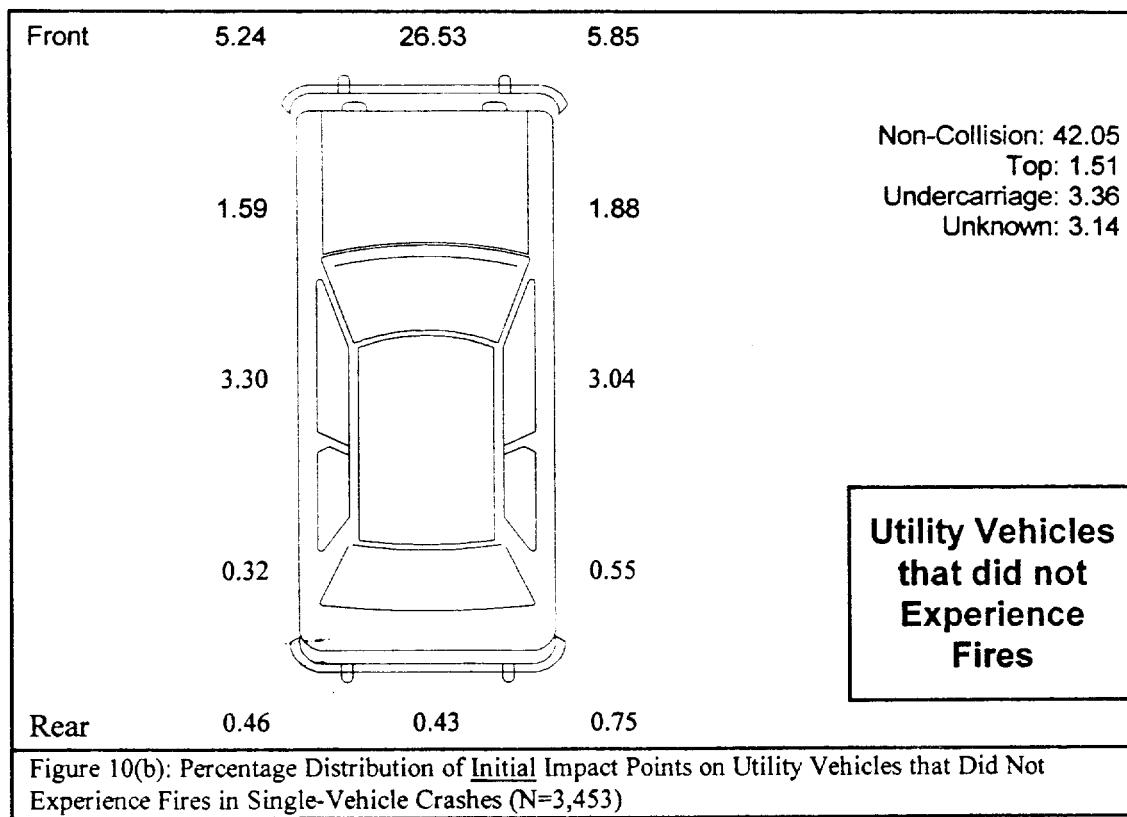

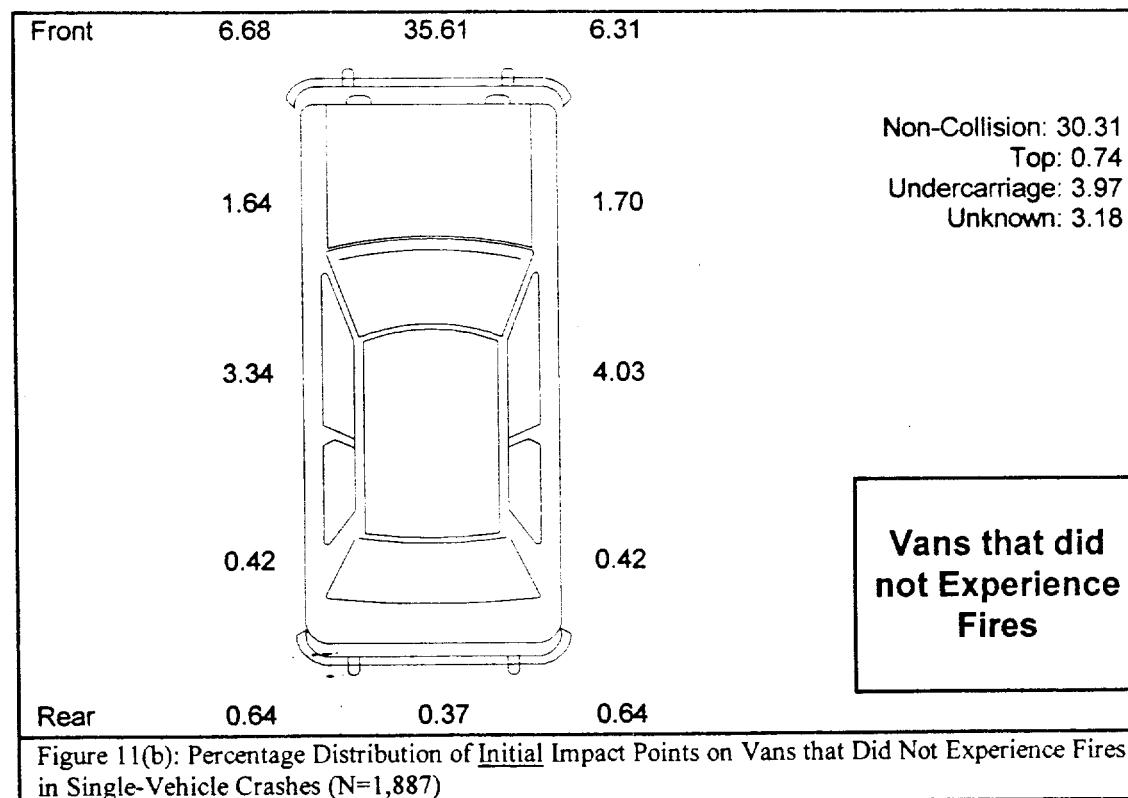

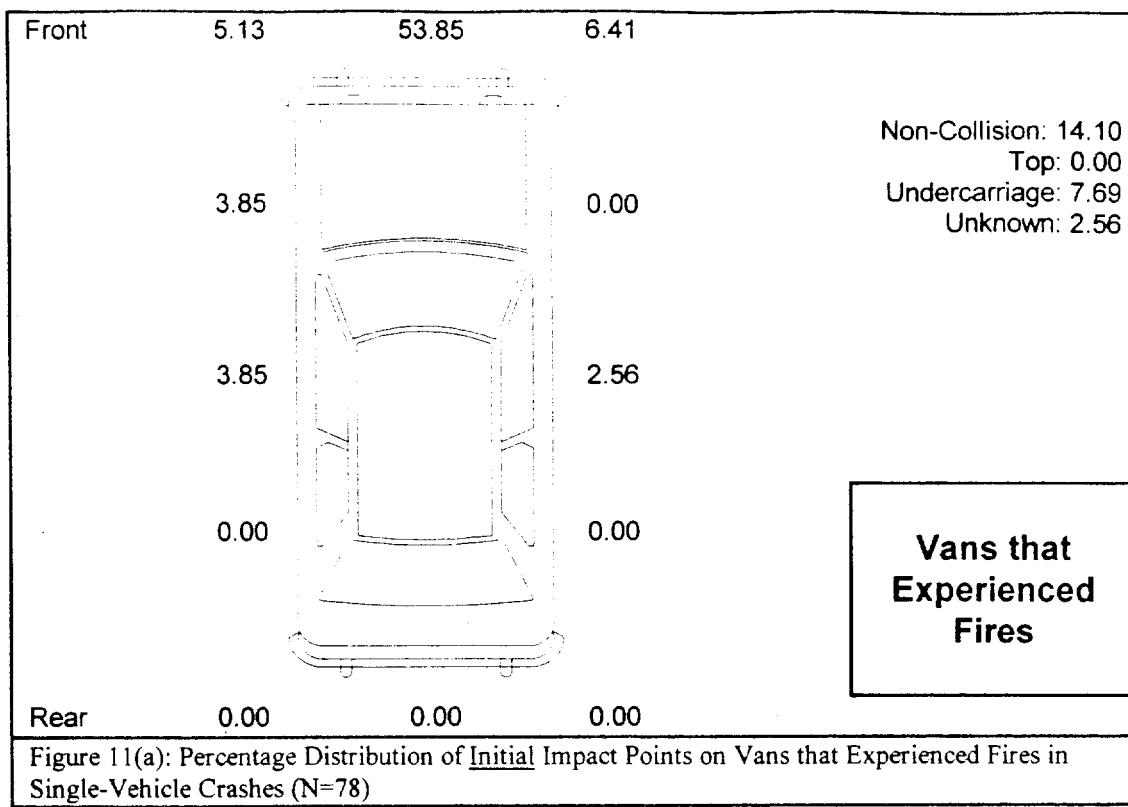

Figure 10(b): Percentage Distribution of Initial Impact Points on Utility Vehicles that Did Not Experience Fires in Single-Vehicle Crashes (N=3,453)

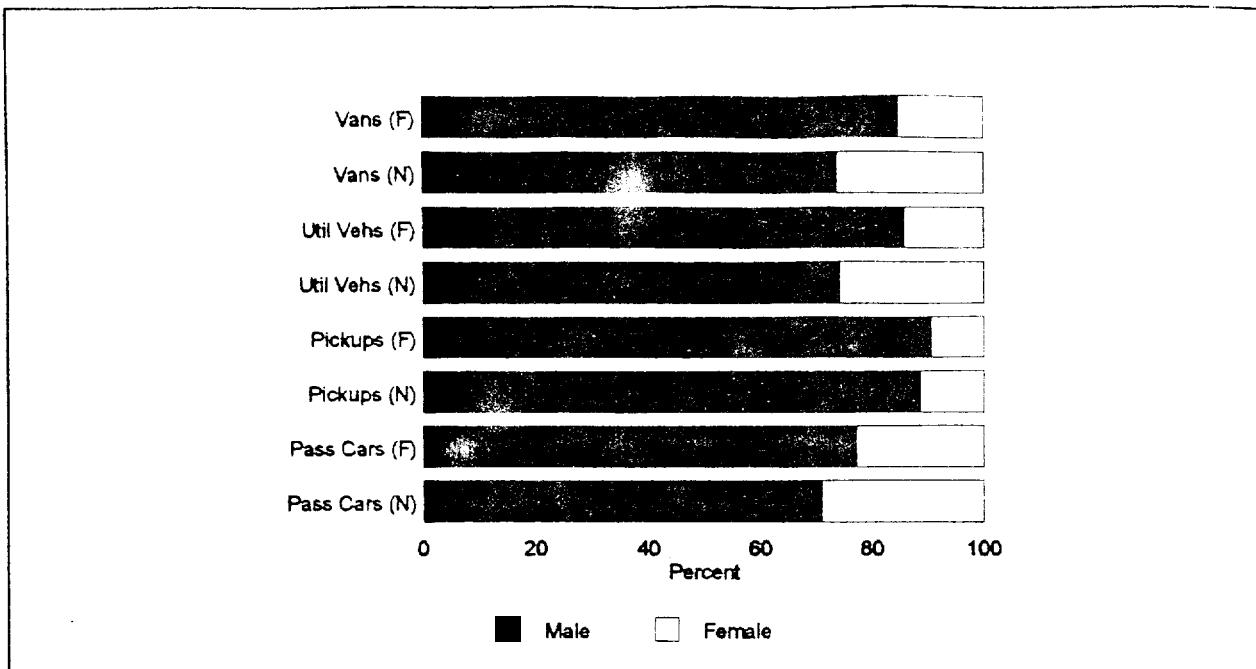

Figure 12: Vehicles Involved in Single-Vehicle Crashes by Sex of Driver, Vehicle Class, and Fire Experience [No Fire (N); Fire (F)]

VEHICLES INVOLVED IN MULTI-VEHICLE CRASHES⁸

Table 3 indicated that between 1994 and 1996 there were 44,260 passenger vehicles involved in fatal, multi-vehicle crashes in this country in which one or more vehicle occupants were killed. These 44,260 vehicles (plus 48,328 other vehicles that were not passenger vehicles—or that were passenger vehicles, but did not contain occupants who were killed) were involved in 41,968 fatal, multi-vehicle crashes (Table 6).

Crash and Vehicle Characteristics

Passenger cars and pickups experiencing fires in multi-vehicle crashes were relatively more likely to have occurred in rural areas. For utility vehicles and vans, the urban/rural differences were not significant (at $\alpha = 0.05$) with regard to fire (Figure 13).

For three of the four vehicle classes (passenger cars, pickups, and vans), vehicle fires were relatively more common on interstates (Figure 14). For utility vehicles, the difference was not significant (at $\alpha = 0.05$).

⁸It should be noted again that the numbers of utility vehicles and vans in the data set that experienced fires in multi-vehicle crashes were relatively few, 93 and 79, respectively (Table 4).

Table 6: Multi-Vehicle Crashes Involving at Least One Passenger Vehicle with a Deceased Occupant (FARS 1994-1996)

Vehicles Involved in Crashes*	Number	Cumulative Number	Cumulative Percent
2	35,575	35,575	84.77
3	5,067	40,642	96.84
4	928	41,570	99.05
5+	398	41,968	100.00

*Vehicle forms submitted (VE_FORMS) was used to define the number of vehicles involved in crashes

Passenger cars, pickups, and utility vehicles that experienced fires in multi-vehicle crashes were relatively more likely to be striking vehicles (as opposed to struck vehicles). Vans that experienced fires in multi-vehicle crashes appeared more likely to be striking vehicles, but this difference was not significant (at $\alpha = 0.05$)(Figure 15).

Passenger cars and pickups that experienced fires in multi-vehicle crashes were also relatively more likely to have occurred during hours of darkness, but for utility vehicles and vans, the differences were not significant (at $\alpha = 0.05$)(Figure 16).

Passenger cars, pickups, and utility vehicles that experienced fires in multi-vehicles crashes had relatively more of their crashes between 10 pm and 4 am. For vans there was no significant difference (at $\alpha = 0.05$)(Figure 17).

Figures 18 through 21 depict, respectively, the initial points of impact for passenger cars, pickups, utility vehicles, and vans involved in multi-vehicle crashes. For passenger cars that experienced fires, impacts at 12 o'clock and 6 o'clock were over represented when compared to vehicles that did not experience fires, while impacts at 3 o'clock and 9 o'clock were under represented (Figure 18). Initial impact points for pickups that did and did not experience fires were fairly comparable (Figure 19). Utility vehicles and vans that experienced fires were somewhat more apt to have initial points of impact at 6 o'clock (Figures 20 and 21).

Driver Characteristics

For passenger cars and utility vehicles that experienced fires in multi-vehicle crashes, the drivers were more likely to be males. For pickups and vans, the differences in the percentages of males who were driving vehicles that did or did not experience fires were not significant (at $\alpha = 0.05$)(Figure 22).

SUMMARY AND COMMENTS

In order to summarize some of the differences found in the previous section, the relative odds of fires in passenger vehicles were calculated for several antecedent or predisposing factors (e.g., darkness, male drivers, vehicle rollovers, etc.). Table 7 demonstrates how the relative odds of vehicles experiencing fires were calculated for these factors.

Table 7: Explanation of Relative Odds

Example 1: Passenger Cars in Single-Vehicle Crashes		Antecedent Factor		Equation for Relative Odds (RO)	Significance	
		Dark	Daylight			
		Fire	854 (a) 283 (c)			
		No Fire	14,718 (b) 9,306 (d)	$RO = a/b \div c/d$ $1.91 = (854/14,718) \div (283/9,306)$	$z = 3.25$ $p < 0.05$	
Interpretation: The odds that a passenger car involved in a single-vehicle crash after dark (in which one or more vehicle occupants are killed) will experience a fire are 1.91 times greater than the odds that a passenger car involved in a single-vehicle crash during daylight hours (in which someone is killed) will experience a fire. The relative odds ratio of 1.91 is significantly different from 1.0 at $\alpha = 0.05$.						
Example 2: Utility Vehicles in Multi-Vehicle Crashes		Antecedent Factor		Equation for Relative Odds (RO)	Significance	
		Striking	Struck			
		Fire	63 (a) 19 (c)			
		No Fire	951 (b) 542 (d)	$RO = a/b \div c/d$ $1.89 = (63/951) \div (19/542)$	$z = 2.38$ $p < 0.05$	
Interpretation: The odds that a “striking” utility vehicle involved in a multi-vehicle crash will experience a fire are 1.89 times greater than the odds that a “struck” utility vehicle involved in a multi-vehicle crash will experience a fire—assuming, again, that both striking and struck vehicles contain at least one fatally-injured occupant. This relative odds ratio of 1.89 is significant at $\alpha = 0.05$.						
The natural logarithm (\ln) of RO is asymptotically normal (z) with a standard error that is equal to the square root of the sum of the reciprocals of the four frequencies used in the calculation of RO.				$z = \frac{\ln(RO)}{\sqrt{1/a + 1/b + 1/c + 1/d}}$		

The relative odds ratios depicted in Table 8 were calculated as explained in Table 7. Note that when the relative odds associated with a given factor are significantly above 1.0, vehicle fires are over represented for that factor. Conversely, when the relative odds associated with a given factor are significantly below 1.0, vehicle fires are under represented for that factor. And, when the relative odds do not differ significantly from 1.0, there is insufficient evidence to indicate that the antecedent factor in question is associated with vehicular fire.

Table 8: Relative Odds of Fire by Type of Crash, Antecedent Factor, and Vehicle Class

Type of Crash	Antecedent Factor	Passenger Cars	Pickups	Utility Vehicles	Vans
Single-Vehicle Crashes	Crash Occurred in a Rural Area	<u>1.00</u>	<u>1.01</u>	<u>1.01</u>	<u>0.81</u>
	First Harmful Event was Striking a Tree	1.61	2.18	3.51	1.96
	Rollover as the First Event in the Crash	0.30	0.28	0.15	0.24
	Crash Occurred After Dark	1.91	1.34	2.00	2.19
	Crash Occurred Between 10 pm and 4 am	1.72	1.54	1.48	<u>1.60</u>
	Driver was Male	1.38	<u>1.23</u>	2.25	1.93
Multi-Vehicle Crash	Crash Occurred in a Rural Area	1.31	1.82	<u>1.44</u>	<u>1.41</u>
	Striking Vehicle in the Crash	1.83	1.84	1.89	<u>1.34</u>
	Crash Occurred After Dark	1.75	1.40	<u>1.42</u>	<u>1.43</u>
	Crash Occurred Between 10 pm and 4 am	2.05	1.63	1.64	<u>1.56</u>
	Driver was Male	1.55	<u>1.08</u>	1.74	<u>1.01</u>

Relative odds ratios in ***bold italics*** are not significantly different from 1.00 at $\alpha = 0.05$

The overall impression that might be gained from the data in Table 8 is that vehicles that experience fires are involved in somewhat more severe crashes, e.g., they are more often driven by males, occur after dark, and between the hours of 10 pm and 4 am.⁹

In single-vehicle crashes, passenger vehicles that collide with trees are much more likely to experience fires than those that do not. Passenger vehicles that overturn are relatively less likely to experience fires.

⁹Note that several of the relative odds ratios for utility vehicles and vans (particularly those involved in multi vehicle crashes) are not significantly different from 1.0, though these ratios are in the same direction exhibited by passenger cars and pickups. With larger samples, it seems reasonable to expect that some of these ratios would have been significant.

In multi-vehicle crashes, passenger vehicle fires are relatively more common for “striking” vehicles than for “struck” vehicles. For passenger cars and pickups, vehicle fires are also more common in rural areas.
